## INTEGRATED PHYSICS \& CHEMISTRY MASS VERSUS WEIGHT

PROBLEM: What relationship exists between mass and weight?

HYPOTHESIS:

MATERIALS: Spring Scales: $2.5 \mathrm{~N}, 5 \mathrm{~N}, 10 \mathrm{~N}, 20 \mathrm{~N}$; graph paper; hooked weight set in grams

PROCEDURE: 1. Using the appropriate spring scale, individually attach each mass listed in the data table below.
2. Record the weight in Newtons of each mass in the data table.
3. Make a Weight vs. Mass Graph on the back of this paper.

OBSERVATIONS:

| MASS IN GRAMS | WEIGHT IN NEWTONS |
| :---: | :---: |
| 50 g |  |
| 100 g |  |
| 200 g |  |
| 500 g |  |
| 1000 g |  |

## QUESTIONS:

1. $1000 \mathrm{~g}=$ $\qquad$ kg
2. $1 \mathrm{~kg}=$ $\qquad$ Newtons
3. What two factors affect the weight of an object?
A. $\qquad$ B. $\qquad$
4. On the moon, would your weight be different than what it is on the earth? Explain.
5. On the moon, would your mass be different than it is on the earth? Explain.
6. Using your graph....
a. what is the weight of 400 grams?
b. what is the weight of 700 grams?
7. Using your graph, what is the mass of 3 Newtons? $\qquad$

CONCLUSION: Based on your observations, re-answer the original problem stated at the beginning of this lab.

GRAPH: Remember to label your axis and make a key!!!
